- Steganography is the process of hiding a secret message within a larger one in such a way that someone can not know the presence or contents of the hidden message
- Aim - To develop a detection system which is capable of detecting the alteration in image both its format and signature thereby predicting the actual type of forged file

# Challenges in Forged File Discovery

- Images without watermarking as digital signatures can be easily manipulated.
- With the advent of new photo editing software - hiding critical informations are easy and unpercieveable
- Task to detect mix of scaled or compressed images as one is difficult
- Incorporating machine learning techniques for feature analysis and decision making to classify the image to be forged or not
- Tamper detection to check for change in the file format extension

- Steganographic method working on the principle of Modified LSB Technique with specific intend of reducing the number of 1's in the secret data
- Methods: Each pixel value of host image is changed if value of secret bit is 1 otherwise the LSB of each pixel value will remain unchanged
- Limitation :
  - Less secure
  - Limited pixel quality
- State-of-the-art methods in terms of PSNR, SSIM
- Future work: Better data mapping mechanism for reduced storage and computational performance

# Digital Image Steganography Using Modified LSB and AES Cryptography[3]

- This method ensures enhanced security of digital images
- Steps involved:
  - The secret message is transformed to cipher text by AES cryptography [
  - The cipher text is hidden inside the image using the modified LSB method
- Methods: Replacing LSB of cover image with the bits of the concealed message and manipulating the LSB plane of the cover image
- Limitation :
  - Less secure: Easy to decrypt secret message
  - Less performance
- Modified LSB shows improved performance based on PSNR, SSIM metrics
- Future work: Performance Improvement based on storage or computational time

- Network (SCNN) capable of distinguishing the boundaries of forged regions from original edges in low resolution images SCNN is designed to utilize the information of chroma and saturation
- Methods:Based on SCNN:
  - Sliding Windows Detection (SWD)
  - Fast SCNN
- Methodology:
  - SWD: We start by picking a certain window of an image
  - Window is feed into SCNN and compute a confidence score to predict whether it is tampered
  - Confidence score and probablity map is maintained
  - Then the window slides over and outputs another confidence score
  - After sliding the window through the entire image, a complete probability map is constructed

- Fast SCNN :
  - Takes entire image as the input
  - Produces feature maps by processing the entire image with Conv layers
  - Extract feature vectors with dimension from feature maps and feed them into fully-connected layers
  - The parameters of Fast SCNN are all trained by SCNN on the patch dataset
- Limitation :
  - Less secure:Easy to decrypt secret message
  - Less performance
- Modified LSB shows improved performance based on PSNR,SSIM metrics
- Future work:Performance Improvement based on storage or computational time

- Steganalysis based on deep learning approach
- Classified as the following categories:
  - Spatial Image Steganalysis
  - JPEG Domain Steganalysis
- Deep Learning based Steganalysis
  - Spatial Domain Steganography Steganalysis based on Deep Neural Network Design
    - Spatial Rich model(SRM)
    - Steganalysis Based on Fusion Approach
    - Steganalysis methods based on Learning Strategy
  - Jpeg Domain Steganography Steganalysis based on Deep Learning
    - Convolutional Neural Network(CNN) with 20 layers
    - CNN with 32 layers combined with SCA-GFR
    - CNN with four  $5 \times 5$  high pass filters, which include a KV filter, a point filter, and 2 Gabor filters, are used to detect stego noise introduced by JPEG-domain embedding scheme

- Deep Learning in Image Steganalysis is still in its initial stage-A generic hybrid deep-learning framework for JPEG steganalysis incorporating the domain knowledge behind rich steganalytic models
- Stages in JPEG Steganalysis:
  - The first stage is hand-crafted, corresponding to the convolution phase followed by for rich model :
    - Quantization phase
    - Truncation phase
  - The second stage is a compound deep-neural network containing multiple deep subnets, in which the model parameters are learned in the training procedure

Papers

- Proposed Model:
  - Preliminaries:
    - The principal part of CNN is a cascade of alternating convolutional layers, regulation layers (eg. BN layers) and pooling layers
- Working :
  - Each neuron unit receives inputs from a previous layer, performs a dot product with weights and optionally follows it with a nonlinear point-wise activation function
  - CNNs can be trained using backpropagation
- Quantisation and Truncation in Steganalysis:
  - Convolution with series of kernel to derive varied noise residuals
  - Quantisation
  - Truncation
  - Aggregation

## ■ SPD Approach:

- Evolutionary method Steganalysis to extract the signature of stego images against clean images via fuzzy ifthen rules
- Blind steganalysis on the discovered knowledge, suitable trained models for steganalysis can be employed and stego images will be detected with high accuracy
- Using SPD, we can predict the type of steganography method from a stego image [ Employing SPD can enhance the approaches, which assume that a special steganography method is used
- The effect of SPD before applying steganalysis methods has been investigated by some steganography and steganalysis techniques and it has been validated using some image databases
- The second stage is a compound deep CNN network in which the model parameters are learned in the training procedure

Papers

- Steps carried out in SPD :
  - Image Feature Selection, Two Groups as methods:
    - Filtering :Select feature subsets independently from the learning classifiers and do not include learning
    - Wrapping :Wrap around a certain learning algorithm that can assess the selected feature subsets in terms of estimated classification errors and then build the final classifiers
  - Fuzzy rule generation : Iterative Rule Learning approach, each individual codes one rule and in each iteration of Genetic Algorithm (GA) a new rule is adapted and added to the rule set, iteratively

- A novel Steganography without Embedding (SWE), which does not need to modify the data of the carrier image, appeared to overcome the detection of machine-learning-based steganalysis algorithms
- SWE method based on deep convolutional generative adversarial networks.
  - Generative Adversarial Network (GAN)
    - GAN and discriminative model [
    - The generative model deceives the discriminative model via generated images that appear like real images while the discriminative model judges whether the images are real or unreal.
  - Deep Convolutional Generative Adversarial Network (DCGAN)
    - Deep convolutional generative adversarial networks (DCGANs) are an extension of GANs in which the models are deep convolutional networks
    - Currently, GANs are widely used for the following works:

- The Proposed Image Steganography without embedding:
  - Train DCGANs on an image set and obtain generator  $G$  after DCGANs convergence.
  - Train a CNN's model, called the extractor  $E$ , based on the recovery errors from a large number of random noise vectors.
  - The sender and the receiver hold the network and parameters of  $G$  and  $E$ , respectively.
- Cover Image Generation
  - Secret message is segmented  $S_i$  and then map each segment  $S_i$  to noise vector  $z_i$  .
  - Generate a cover image stego $i$  from the noise vector  $z_i$  with the help of DCGANs
- Training of the Extractor
  - We design the CNNs, called the extractor  $E$ , to recover the secret data from stego images generated by  $G$  .
  - Has four convolutional fully connected layer .
